TITLE: Curie points of cementite after isolation from alloy steels

PERIODICAL: Akademiya nauk SSSR. Izvestiya. Otdeleniye  
tekhnicheskikh nauk. Metallurgiya i gornoye delo.  
no.1, 1963, 119-120

TEXT: Since the magnetic properties of isolated alloyed cementite have not been adequately studied and existing literature data are contradictory, the authors determined the Curie points of cementite isolated from seven alloy steels (composition given). The steels were induction melted and the ingots forged into rods from which specimens were prepared. The specimens were homogenized and hardened from 950 or 1300°C in a 10% potassium hydroxide aqueous solution or oil. Each type of steel was annealed by 5 to 6 different methods to obtain the maximum content of the alloy element in cementite. The cementites were isolated electrolytically. The proportions of the alloying elements in the carbide residues were determined chemically and the amounts dissolved in a Card 1/2

E075/1452

Curie points of cementite ...

given carbide were determined from changes in volume of the cubic lattice or from the spacing. The effect of temperature on the magnetization of carbide powder was determined with a magnetic balance in fields far removed from saturation. It was found that the Curie point of the cementite was not changed by alloying the steel with nickel, niobium or vanadium. Alloying the steel with tungsten somewhat lowered the Curie point temperature. Alloying the steel with molybdenum reduced it still more. Cobalt, which dissolves in cementite in large quantities, caused a very marked decrease in the Curie point temperature. There are 1 figure and 2 tables.

TITLE: Climatic characteristics of the wind in a model of the standard atmosphere

SOURCE: Moscow. Nauchno-issledovatel'skiy Institut aeroklimatologii. Trudy\*, no. 24, 1963, 66-91

TOPIC TAGS: standard atmosphere, meteorology, climatology, wind, wind velocity, wind direction, troposphere, stratosphere

ABSTRACT: A method has been developed for processing aerological observations for a 10-year period (1950-1959) to the 30-mb isobaric surface for the determination of wind characteristics, averaged over large regions and the hemisphere. The determined characteristics are recommended as the first variant of a model of a standard atmosphere for the northern hemisphere. Wind parameters were determined for January, for July and for the year to a height of 25 km. The principal parameters used for this model were the mean scalar velocity of the wind for the month and the year and the resultant wind vector (value and direction). Both characteristics were determined using data for 200 stations, a total of 470,000 observations, processed by electronic computer. Principles and methods employed in this study are described fully. The many difficulties in handling this complex problem

Card 3/3

ACCESSION NR: AT4028301

are discussed. Wind parameters are summarized and analyzed for six geographic regions within which the character of wind distribution can be considered homogeneous in the first approximation. Nonuniformity of station distribution and decreasing number of observations at greater heights are taken into account. In this process data were averaged for 206 equal-area squares in the northern hemisphere. The six regions for which data are generalized are: polar regions; Europe and part of Asia; North America and the North Atlantic; North Africa and Central Asia; North Pacific Ocean and the Far East; and the equatorial and tropical regions. The following section headings indicate the nature of the development of the paper: Introduction; characteristics of the data used; principal geographic regions defined for the purpose of description of wind over the northern hemisphere; the wind vector as a random value; determination of the climatic characteristics of the wind; general principles for determining mean parameters for regions and the hemisphere; averaging data for stations; averaging data for regions and the hemisphere; determination of wind characteristics for standard heights; practical computation of derivatives of wind parameters at standard heights. Orig. art. has: 29 formulas, 11 figures and 3 tables.

TOPIC TAGS: atmospheric temperature, wind direction, climatology, atmospheric pressure, wind velocity, troposphere, weather map, diurnal variation

PURPOSE AND COVERAGE: The book examines the distribution peculiarities of absolute interdiurnal variations in temperature, pressure, wind velocity and direction at different levels of troposphere over the USSR. Maps of interdiurnal variations are included. They contain elements of four central seasonal months, which give a picture of the peculiarities of seasonal and geographical variations. The book is intended for scientific and operative workers in meteorology and aeroclimatology.

TITLE: The Intensified Investigation of Kerosene-Gas Oil Fractions of Direct Distillation and Catalytic Cracking

PERIODICAL: V sb.: Sostav i svoystva neftey i benzino-kerosinovykh fraktsiy. Moscow, AN SSSR, 1957, pp 467-497

ABSTRACT: Kerosene-gas oil fractions of 200 - 350°C of Romashkino Devon petroleum (R), 200 - 400°C of Tuymazy Devon petroleum (T) and gas oil of catalytic cracking of Romashkino petroleum (C) were investigated by a combination of the methods of exact rectification, deparaffination by carbide, chromatography on SiO<sub>2</sub>, catalytic dehydrogenation and structure-group analysis of narrow fractions (with the application of infrared spectroscopy to n-paraffins). In R, 14% of n-paraffins and 38% of aromatic hydrocarbons (H) were found, in T-14 and 33%, respectively. The monocyclic and bicyclic aromatic H of both fractions contain naphthalene rings and S-compounds. The total quantity of naphthenes in R is 19%, in T - 24% (8.8% six-membered naphthenes). In C 14% n-paraffins, 66% aromatic + unsaturated

Card 1/2

paraffins are contained (11.5% unsaturated). Mono-, bi-, tri- and polycyclic aromatic H have been found; the naphthalene rings contain only monocyclic H, the S content reaches 5.4%. The content of naphthalenes is 5 - 6% (in individual fractions 10 - 15%). The individual n-paraffins of all three fractions can be separated with a high degree of purity.

PURPOSE: This collection of articles is intended for scientific analysis laboratory workers at ferrous and nonferrous metallurgical plants, as for basic research workers and similar scientific research laboratories.

ORGANIZATION: The collection contains papers read at the Second Ural'sk Conference on the spectral analysis of ferrous and nonferrous metals and alloys, glass, coke, refractories, ceramics and other materials used in industry. The materials of the conference include articles on the analysis of steels (including the determination of carbon), ferromanganese, manganese and light metals and alloys, pure metal analysis, as well as various methods of quantitative analysis. The collection also includes all research laboratories, etc., to provide the reader with a general idea of the methods used in analytical spectroscopy.

REPORTER: The author: Chaus, R. I. Editor: V. N. Matyshev. Address: All of the articles are accompanied by references.

**PROGRESS**. This book is intended for chemists, chemical engineers, and technicians specializing in the chemistry of petroleum.

**CONTENTS:** The book is a collection of papers presented at the third International Seminar on the Chemistry of Organic Sulfur and Nitrogen Compounds Contained in Petroleum and Petroleum Products. The scientific session was held in U.S.A., June 26-30, 1957. The book consists of six sections: 1) Preparation, characterization, and analysis of organic sulfur compounds; 2) Separation and measurement of organic sulfur compounds contained in petroleum and petroleum products; 3) Transformation of organic sulfur compounds by thermal catalysis; 4) Comparative properties and the formation in sulfur-containing petroleum and petroleum products; 5) Uses of organic sulfur compounds and by-products; 6) Physiological properties of organic sulfur compounds. 36 permanent titles are mentioned. There are 315 references, of which 279 are Soviet, 113 English, 5 French, 12 German, and 2 Czech.

TITLE: Effect of refining processes on the hydrocarbon composition of fractions containing organic sulfur compounds

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 19, 1961, 421, abstract 19M155 (Sb. "Khimiya sera- i azotorgan. soyedineniy, soderzhashchikhsya v neftyakh i nefteproduktakh". Ufa, v. 3, 1960, 397 - 405)

TEXT: Fractions of monocyclic and bicyclic aromatics which were separated from gas oil obtained by direct distillation and by catalytic cracking, were purified from sulfur compounds by adsorption on ACK (ASK) silica gel. Refining was conducted by two methods: (a) oxidation with  $H_2O_2$  in acetic medium, (b) by hydrogenation on an aluminum - cobalt - molybdenum catalyst. Aromatic hydrocarbons were oxidized within 8 hr at  $70^{\circ}C$ . The total content of aromatic hydrocarbons in the fractions proved to be unchanged after refining by oxidation. The number of aromatic rings calculated by the method  $n = d - M$  was somewhat reduced, especially as regards bicyclic aromatics. The elementary composition of oxidized organic sulfur compounds Card 1/2

Effect of refining...

S/081/61/000/019/064/085  
B117/B110

was studied. Hydrogenation of the benzene cycle in hydrogenative refining of monocyclic aromatic hydrocarbons was not noticed on the aluminum - cobalt - molybdenum catalyst at an initial H<sub>2</sub> pressure of 70 atm and a temperature of 350°C. In hydrogenative refining of bicyclic aromatics considerable amounts of tetralin derivatives were obtained. [Abstracter's note: Complete translation] ✓

TITLE: Amalgamation of Fe-Ni alloys

SOURCE: Leningrad. Gorny\*y institut. Zapiski, v. 42, no. 3, 1963. Khimlya, metallurgiya, obogashcheniye (Chemistry, metallurgy, ore concentration), 25-34

TOPIC TAGS: nickel iron alloy, permalloy, kovar, alloy EI996, platinum, Armco iron, nickel iron alloy amalgamation, zinc amalgam, alloy surface wettability, oxide film effect, amalgamation

ABSTRACT: Amalgamation of Permalloy, Kovar (18% Co, 29% Ni, 53% Fe), alloy EI996 (2% Be, 98% Ni), platinum and "Armco" iron was studied by measuring wettability by mercury under various conditions calculated to prevent formation of oxide films. These included hydrogen reduction of the test plates and wetting under an acid layer following electrolytic reduction of oxide films. Surface preparation and experimental techniques are described. Other experiments involved effects of temperature, environment, hydrogen pressure and the Hg-Pd contact period on solubility of Pd coatings in mercury, as well as the wetting of these metal and alloy surfaces by zinc, ammonium and sodium amalgams. The results indicate that amalgamation of iron-nickel alloys cannot be effected

Card

1/2

ACCESSION NR: AT4043065

by standard methods, as wetting of the metal surface by mercury is obstructed by the instantaneous formation of oxide films. Hydrogen reduction of oxides was ineffective due to immediate reoxidation and even contacts in a hydrogen atmosphere did not insure good results in most cases. However, exposure of the metal surface to zinc amalgam in an acid medium insured good amalgamation. Orig. art. has 1 table, 5 graphs, 3 chemical equations and 1 diagram.

AUTHOR: Zverkin, A.M.

SOV/20-128-5-4/67

TITLE: On the Theory of Linear Differential Equations Having a  
Lagging Argument and Periodic Coefficients

PERIODICAL: Doklady Akademii nauk SSSR, 1959, Vol 128, Nr 5, pp 882-885 (USSR)

ABSTRACT: The author states that not every linear differential equation with constant lagging of the argument can be reduced by linear transformation to an equation with constant coefficients. On the other hand there exists a class of irreducible equations, the partial solutions of which can be determined by means of the roots of a characteristic quasipolynomial. The author proposes a method which permits to obtain in this way a partial solution of

$$(6) \quad y'(t) = \sum_{k=0}^m a_k(t)y(t-kT),$$

where  $a_k(t+T)=a_k(t)$ . He discusses the transfer of the method to systems. The obtained particular solutions form a fundamental system (sufficient condition), if the given system of equations is reducible to a system with constant coefficients. The author formulates a theorem on the stability of

TITLE: A series expansion for the solution of linear differential difference equations. Part I, Quasi polynomials

SOURCE: Ref zh. Matem, Abs. 2B311

REF SOURCE: Sb. Tr. Seminara po teorii differents. uravn. s otklon. argumentom. T. 3.  
M., 1964, 3-38

TOPIC TAGS: linear differential equation, differential equation solution, difference equation, asymptotic expansion

ABSTRACT: The properties of the quasi-polynomials

$$D(\lambda) = \sum_{r=0}^n \sum_{p=0}^m a_{rp} \lambda^r e^{-r_p \lambda}$$

are studied with  $a_{rp}$  and  $r_p$  constants. Some peculiarities of the distribution of the roots of quasi-polynomials  $D(\lambda)$  are established together with their asymptotic behavior. The paper is basically a survey although it contains original proofs of certain theorems (estimates from below of the distance between the roots of the quasi-polynomial; the maximum possible multiplicity of the roots of the quasi-polynomial; the establishment of the fact that there exists only a single root with such a multi-

Card 1/2

ACC NR: AR6020782

plicity, and the method is given for its finding; the estimates of the number of roots within the bands parallel to the real axis are also refined). Numerous already known theorems are proved by new methods. It is noted that the second part of the paper will be devoted to the expansion of the solution of linear stationary equations with varying arguments into series over the basic solutions of the form  $P(t)e^{\lambda_1 t}$ , where  $P(t)$  is a polynomial, and  $\lambda_1$  is the root of the characteristic quasi-polynomial.

AUTHOR: Zverkin, A. M.

TITLE: The Dependence of the Stability of Solutions of Linear  
Differential Equations With Lagging Argument on the  
Choice of the Initial Moment

PERIODICAL: Vestnik Moskovskogo universiteta. Seriya matematiki,  
mekhaniki, astronomii, fiziki, khimii, 1959, No. 5, pp. 15-20

TEXT: The author considers equations of the type

$$(1) \quad y'(x) = \int_0^{x(s)} y(x-s) dr(x,s), \quad \Delta(x) \geq 0,$$

where the integration in the Stieltjes integral is carried out with respect to s. The author investigates the dependence of the stability of the solution on the initial moment of the perturbations. Especially the author considers cases, where the stability does not depend on the moment of the disturbing influence.

Theorem 1: For the stability of the trivial solution of (1), where r(x,s) is a nondecreasing function of s for arbitrary x,  $A \leq x < \infty$ , it is necessary and sufficient that the integral

$$\int_A^\infty r(x, \Delta(x)) - r(x,0) dx$$

Card 1/2

A

69470

S/055/59/000/05/002/020

The Dependence of the Stability of Solutions of Linear Differential Equations With Lagging Argument on the Choice of the Initial Moment exists.

Theorem 4: If in the equation

$$(5) \quad y'(x) = a(x)y(x) + b(x)y(x - \tau(x)), \quad \tau(x) \geq 0$$

it is  $b(x) > 0$  for  $x > M$  and  $b(x) \neq 0$  in  $[A, M]$ ,  $\tau(x) \geq \alpha > 0$  and  $\tau'(x) \leq 1 - \beta$ ,  $\beta > 0$ , then from the stability under perturbations in the point  $A$  it follows the stability under perturbations in an arbitrary point.

There are 2 Soviet references.

TITLE:

The Oxidation of Zirconium at High Temperatures and the  
Structure of the Primary Oxide Films (Okisleniye tsirkoniya  
pri vysokikh temperaturakh i struktura pervichnykh oksidnykh  
plenok)

PERIODICAL:

Atomnaya energiya, 1958, Vol 5, Nr 5, pp 550-553 (USSR)

ABSTRACT:

The investigation was carried out with two different layers of zirconium. In the first case, a small zirconium plate (dimensions: 8 . 15 . 0,5 mm) was used, which was produced by hot rolling. The plate was then annealed for one hour at a temperature of 700°C. Before oxidation the plate was chemically polished in a solution of 40 % nitric acid, 5 % hydrofluoric acid, and 55 % water. Oxidation took place in steam and dry oxygen at temperatures of from 150 to 800°C and under atmospheric pressure. The time of exposure varied between 15 minutes and 10 hours. By means of the scattering method the electrograms were taken on an electronograph of the type EM-4.

Card 1/3

SOV/89-5-5-7/27

The Oxidation of Zirconium at High Temperatures and the Structure of the Primary Oxide Films

In the second case the zirconium foils were produced by evaporation of the zirconium in a vacuum on a mica base. The foils produced were removed from the mica base in distilled water. Oxidation was carried out as described above. The radiographic investigations were carried out by means of a camera of the type RKU-86 (Cr radiation). It was found that oxidation develops in stages. During the first stage of oxidation a thin layer with a marked textured cubic modification and characterized by very considerable passivation forms. The second stage is characterized by the occurrence of a textured monoclinic modification, which is located above the cubic modification. A further increase of the thickness of the foil is possible only at the expense of the increase of the internal monoclinic modification. The third stage of oxidation is characterized by the vanishing of the textured black oxidation layer which consists of the cubic and monoclinic modifications. The black layer goes over into a white one. At this instant the rate of oxidation of zirconium increases very considerably.

The resistance to corrosion of the black layer might be

Card 2/3

SOV/89-5-5-7/27

The Oxidation of Zirconium at High Temperatures and the Structure of the Primary Oxide Films

brought into connection with the presence of a textured solid solution of zirconium in  $ZrO_2$ . It was possible to show that the protective properties of the black layer apparently vanish as soon as a maximum of saturation of this solid solution with oxygen is attained. The consequence is that a non-textured white zirconium oxide with the well-known stoichiometric composition is formed. There are 6 figures, 2 tables, and 6 references, 0 of which is Soviet.

TITLE: Machine for Studying the Endurance of Tubes Under Pressure  
With Cyclic Deflection (Mashina dlya issledovaniya  
dlitel'noy prochnosti trub pod davleniyem s tsiklicheskim  
izgibom)

PERIODICAL: Zavodskaya Laboratoriya, 1958, Vol 24, Nr 12,  
pp 1514 - 1516 (USSR)

ABSTRACT: The machine mentioned in the title was developed, produced,  
and used in the institute mentioned in the association  
in the beginning of 1957. The testing conditions  
correspond to the working conditions of tubes and vapor  
conductors in boiler works. The diagram given (Fig. 1)  
indicates that the tube sample is located in an electric  
furnace. The loading for the cyclic bending of the  
sample is carried out using an electric motor over an  
eccentric wheel. The pressure within the system is  
achieved in the same way as in the TsKTI apparatus,  
used for testing the endurance of tubes toward internal

Card 1/2

Machine for Studying the Endurance of Tubes Under Pressure With Cyclic Deflection

SOV/32-24-12-37/45

pressure (Ref 1). The error in measurement in relation to the bending moment is about 3%. The placing of the machine on the desired loading cycle is carried out by using cells attached to the lever. 15, 30, and 60 cycles per minute are proposed. Two samples can be determined simultaneously on the machine. There are 2 figures and 1 Soviet reference.

TITLE: The long term strength of tubes with complex loading. (Dlitel'naya prochnost' trub pri slozhnykh nagruzkakh.)

PERIODICAL: Teploenergetika, 1958, No.3. pp. 51-54 (USSR)

ABSTRACT: An installation for testing the long term strength of tubes with combined internal pressure and bending is illustrated diagrammatically in Fig.1 and a corresponding installation for combined pressure and torsion in Fig.2. The test section of the tube was contained in an electric furnace. The accuracy of the test data was of the order of 3 - 5%. The test specimens were made of austenitic steel 3H-694 (1X13H16B). For long term tensile tests the samples were made in the form of cylinders of 4.6 - 5.1 mm diameter with a length to diameter ratio of about 10 cut from the wall of the tube. For the main tests the specimens were pieces of steam superheater tubes of 32 x 5.6 mm in the condition as delivered. Tables 1 & 2 give data on long term strength tests on specimens in tension and tubes under pressure. Table.3 gives data for tubes subject only to torque and they lost their stability, large cracks were formed on the surface of the specimens. The results of tests with combined pressure and twisting are given in Table.4. There were individual cracks formed on the outer surface of the specimens and on the internal surface there was a network of fine cracks. (See illustrations in Figs.3 & 4). The results of tests on tubes

ORIG. PUB. : Vrachebn. delo, 1957, No. 4, 347--350  
ABSTRACT : Of the 75 patients followed, 14 had agranulocytosis, 37 had other types of leukopenia, and 24 had normal leukocyte levels. Autoantibodies (leukoagglutinins and leukolysins) were detected in the serum of the patients with agranulocytosis. The serum of these patients agglutinated the granulocytes in the blood of healthy subjects and patients with myeloid leukemia, but did not agglutinate lymphocytes and monocytes. A relationship was established between the intensity of agglutination and leukolysis and the clinical state of the

782. ROLE OF VITAMIN A AND CAROTENE IN SOME SKIN DISEASES OF INFANTS IN THEIR FIRST YEAR OF LIFE (Russian text) - Zverkova F. A. - VOPR. OKHR. MATER. I DETS. 1957, 2 (19-27)

Blood concentration of vit. A and carotene of breast-fed infants suffering from various skin diseases and of their mothers was studied. A control group of healthy babies and their mothers was also investigated. It was found that: (1) Vit. A and carotene contents of the blood of healthy infants under one year of age show seasonal variation and changes dependent on the type of feeding. (2) In the case of erythroderma desquamativum the blood level of those substances is greatly lowered. (3) This fall depends on both exogenic and endogenic factors (gastro-intestinal disorders, disorders of liver function). (4) Vit. A and carotene concentration in the blood and milk of mothers breastfeeding babies suffering from erythroderma desquamativum is low. Addition of those substances to the diet of the mothers constitutes an integral part of the treatment. (5) In dermatitis herpetiformis of the newborn the blood levels of vit. A and carotene are low. This fall becomes even more accentuated in exfoliative dermatitis. (6) In cases of infantile eczema the amounts of circulating vit. A and carotene are larger than normal as a result of interference with general metabolism. (7) Administration of vit. A to infants suffering from eczema helps in restoration of normal metabolism. Administration of vit. A during pregnancy, especially in cases of toxæmia of pregnancy, is an important factor in prevention of skin disease in infants. (S)

TITLE: Curie points of cementite after isolation from alloy steels

PERIODICAL: Akademiya nauk SSSR. Izvestiya. Otdeleniye  
tekhnicheskikh nauk. Metallurgiya i gornoye delo.  
no.1, 1963, 119-120

TEXT: Since the magnetic properties of isolated alloyed cementite have not been adequately studied and existing literature data are contradictory, the authors determined the Curie points of cementite isolated from seven alloy steels (composition given). The steels were induction melted and the ingots forged into rods from which specimens were prepared. The specimens were homogenized and hardened from 950 or 1300°C in a 10% potassium hydroxide aqueous solution or oil. Each type of steel was annealed by 5 to 6 different methods to obtain the maximum content of the alloy element in cementite. The cementites were isolated electrolytically. The proportions of the alloying elements in the carbide residues were determined chemically and the amounts dissolved in a Card 1/2

5/270/63/000/001/011/025

E075/1452

Curie points of cementite ...

given carbide were determined from changes in volume of the cubic lattice or from the spacing. The effect of temperature on the magnetization of carbide powder was determined with a magnetic balance in fields far removed from saturation. It was found that the Curie point of the cementite was not changed by alloying the steel with nickel, niobium or vanadium. Alloying the steel with tungsten somewhat lowered the Curie point temperature. Alloying the steel with molybdenum reduced it still more. Cobalt, which dissolves in cementite in large quantities, caused a very marked decrease in the Curie point temperature. There are 1 figure and 2 tables.

TITLE: Climatic characteristics of the wind in a model of the standard atmosphere

SOURCE: Moscow. Nauchno-issledovatel'skiy Institut aeroklimatologii. Trudy\*, no. 24, 1963, 66-91

TOPIC TAGS: standard atmosphere, meteorology, climatology, wind, wind velocity, wind direction, troposphere, stratosphere

ABSTRACT: A method has been developed for processing aerological observations for a 10-year period (1950-1959) to the 30-mb isobaric surface for the determination of wind characteristics, averaged over large regions and the hemisphere. The determined characteristics are recommended as the first variant of a model of a standard atmosphere for the northern hemisphere. Wind parameters were determined for January, for July and for the year to a height of 25 km. The principal parameters used for this model were the mean scalar velocity of the wind for the month and the year and the resultant wind vector (value and direction). Both characteristics were determined using data for 200 stations, a total of 470,000 observations, processed by electronic computer. Principles and methods employed in this study are described fully. The many difficulties in handling this complex problem

Card 3/3

ACCESSION NR: AT4028301

are discussed. Wind parameters are summarized and analyzed for six geographic regions within which the character of wind distribution can be considered homogeneous in the first approximation. Nonuniformity of station distribution and decreasing number of observations at greater heights are taken into account. In this process data were averaged for 206 equal-area squares in the northern hemisphere. The six regions for which data are generalized are: polar regions; Europe and part of Asia; North America and the North Atlantic; North Africa and Central Asia; North Pacific Ocean and the Far East; and the equatorial and tropical regions. The following section headings indicate the nature of the development of the paper: Introduction; characteristics of the data used; principal geographic regions defined for the purpose of description of wind over the northern hemisphere; the wind vector as a random value; determination of the climatic characteristics of the wind; general principles for determining mean parameters for regions and the hemisphere; averaging data for stations; averaging data for regions and the hemisphere; determination of wind characteristics for standard heights; practical computation of derivatives of wind parameters at standard heights. Orig. art. has: 29 formulas, 11 figures and 3 tables.

TOPIC TAGS: atmospheric temperature, wind direction, climatology, atmospheric pressure, wind velocity, troposphere, weather map, diurnal variation

PURPOSE AND COVERAGE: The book examines the distribution peculiarities of absolute interdiurnal variations in temperature, pressure, wind velocity and direction at different levels of troposphere over the USSR. Maps of interdiurnal variations are included. They contain elements of four central seasonal months, which give a picture of the peculiarities of seasonal and geographical variations. The book is intended for scientific and operative workers in meteorology and aeroclimatology.

TITLE: The Intensified Investigation of Kerosene-Gas Oil Fractions of Direct Distillation and Catalytic Cracking

PERIODICAL: V sb.: Sostav i svoystva neftey i benzino-kerosinovykh fraktsiy. Moscow, AN SSSR, 1957, pp 467-497

ABSTRACT: Kerosene-gas oil fractions of 200 - 350°C of Romashkino Devon petroleum (R), 200 - 400°C of Tuymazy Devon petroleum (T) and gas oil of catalytic cracking of Romashkino petroleum (C) were investigated by a combination of the methods of exact rectification, deparaffination by carbide, chromatography on SiO<sub>2</sub>, catalytic dehydrogenation and structure-group analysis of narrow fractions (with the application of infrared spectroscopy to n-paraffins). In R, 14% of n-paraffins and 38% of aromatic hydrocarbons (H) were found, in T-14 and 33%, respectively. The monocyclic and bicyclic aromatic H of both fractions contain naphthalene rings and S-compounds. The total quantity of naphthenes in R is 19%, in T - 24% (8.8% six-membered naphthenes). In C 14% n-paraffins, 66% aromatic + unsaturated

The Intensified Investigation of Kerosene-Gas Oil Fractions of Direct Distillation and Catalytic Cracking

paraffins are contained (11.5% unsaturated). Mono-, bi-, tri- and polycyclic aromatic H have been found; the naphthalene rings contain only monocyclic H, the S content reaches 5.4%. The content of naphthalenes is 5 - 6% (in individual fractions 10 - 15%). The individual n-paraffins of all three fractions can be separated with a high degree of purity.

**NOTES:** This book is intended for chemists, chemical engineers and technical specialists in the chemistry or petrology of sulfur compounds. The book is a collection of papers presented at the Third Scientific Session on the Chemistry of Elemental Sulfur and Hydrogen Compounds Contained in Petroleum and Petroleum Products. The scientific session was held in Ufa, USSR, Sept., 1951. The book consists of six sections: 1) Hydrosulfurization; and analysis of organic sulfur compounds; 2) Separation and composition of organic sulfur compounds contained in petroleum and petroleum products; 3) Transformation of organic sulfur compounds by thermal catalysis; 4) Chemical properties of sulfur compounds in sulfur-containing petroleum and petroleum products; 5) Uses of organic sulfur compounds and hydrogen sulfide; 6) Petrological properties of organic sulfur compounds. In parentheses are mentioned: There are 115 references, of which 109 are Soviet, 113 English, 5 French, 12 German, and 2 Czech.

TITLE: Effect of refining processes on the hydrocarbon composition of fractions containing organic sulfur compounds

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 19, 1961, 421, abstract 19M155 (Sb. "Khimiya sera- i azotorgan. soyedineniy, soderzhashchikhsya v neftyakh i nefteproduktakh". Ufa, v. 3, 1960, 397 - 405)

TEXT: Fractions of monocyclic and bicyclic aromatics which were separated from gas oil obtained by direct distillation and by catalytic cracking, were purified from sulfur compounds by adsorption on ACK (ASK) silica gel. Refining was conducted by two methods: (a) oxidation with  $H_2O_2$  in acetic medium, (b) by hydrogenation on an aluminum - cobalt - molybdenum catalyst. Aromatic hydrocarbons were oxidized within 8 hr at  $70^{\circ}C$ . The total content of aromatic hydrocarbons in the fractions proved to be unchanged after refining by oxidation. The number of aromatic rings calculated by the method  $n = d - M$  was somewhat reduced, especially as regards bicyclic aromatics. The elementary composition of oxidized organic sulfur compounds Card 1/2

Effect of refining...

S/081/61/000/019/064/085

was studied. Hydrogenation of the benzene cycle in hydrogenative refining of monocyclic aromatic hydrocarbons was not noticed on the aluminum - cobalt - molybdenum catalyst at an initial H<sub>2</sub> pressure of 70 atm and a temperature of 350°C. In hydrogenative refining of bicyclic aromatics considerable amounts of tetralin derivatives were obtained. [Abstracter's note: Complete translation] ✓

AUTHOR: Maslenitskiy, I. N., Zverevich, N. V.

TITLE: Amalgamation of Fe-Ni alloys

SOURCE: Leningrad. Gorny\*y institut. Zapiski, v. 42, no. 3, 1963. Khimlya, metallurgiya, obogashcheniye (Chemistry, metallurgy, ore concentration), 25-34

TOPIC TAGS: nickel iron alloy, permalloy, kovar, alloy EI996, platinum, Armco iron, nickel iron alloy amalgamation, zinc amalgam, alloy surface wettability, oxide film effect, amalgamation

ABSTRACT: Amalgamation of Permalloy, Kovar (18% Co, 29% Ni, 53% Fe), alloy EI996 (2% Be, 98% Ni), platinum and "Armco" iron was studied by measuring wettability by mercury under various conditions calculated to prevent formation of oxide films. These included hydrogen reduction of the test plates and wetting under an acid layer following electrolytic reduction of oxide films. Surface preparation and experimental techniques are described. Other experiments involved effects of temperature, environment, hydrogen pressure and the Hg-Pd contact period on solubility of Pd coatings in mercury, as well as the wetting of these metal and alloy surfaces by zinc, ammonium and sodium amalgams. The results indicate that amalgamation of iron-nickel alloys cannot be effected

Card

1/2

ACCESSION NR: AT4043065

by standard methods, as wetting of the metal surface by mercury is obstructed by the instantaneous formation of oxide films. Hydrogen reduction of oxides was ineffective due to immediate reoxidation and even contacts in a hydrogen atmosphere did not insure good results in most cases. However, exposure of the metal surface to zinc amalgam in an acid medium insured good amalgamation. Orig. art. has 1 table, 5 graphs, 3 chemical equations and 1 diagram.

SOV/20-128-5-4/67

TITLE: On the Theory of Linear Differential Equations Having a  
Lagging Argument and Periodic Coefficients

PERIODICAL: Doklady Akademii nauk SSSR, 1959, Vol 128, Nr 5, pp 882-885 (USSR)

ABSTRACT: The author states that not every linear differential equation with constant lagging of the argument can be reduced by linear transformation to an equation with constant coefficients. On the other hand there exists a class of irreducible equations, the partial solutions of which can be determined by means of the roots of a characteristic quasipolynomial. The author proposes a method which permits to obtain in this way a partial solution of

$$(6) \quad y'(t) = \sum_{k=0}^m a_k(t)y(t-kT),$$

where  $a_k(t+T)=a_k(t)$ . He discusses the transfer of the method to systems. The obtained particular solutions form a fundamental system (sufficient condition), if the given system of equations is reducible to a system with constant coefficients. The author formulates a theorem on the stability of

ABSTRACT: The properties of the quasi-polynomials

$$D(\lambda) = \sum_{r=0}^n \sum_{p=0}^m a_{rp} \lambda^r e^{-r_p \lambda}$$

are studied with  $a_{rp}$  and  $r_p$  constants. Some peculiarities of the distribution of the roots of quasi-polynomials  $D(\lambda)$  are established together with their asymptotic behavior. The paper is basically a survey although it contains original proofs of certain theorems (estimates from below of the distance between the roots of the quasi-polynomial; the maximum possible multiplicity of the roots of the quasi-polynomial; the establishment of the fact that there exists only a single root with such a multi-

Card 1/2

ACC NR: AR6020782

plicity, and the method is given for its finding; the estimates of the number of roots within the bands parallel to the real axis are also refined). Numerous already known theorems are proved by new methods. It is noted that the second part of the paper will be devoted to the expansion of the solution of linear stationary equations with varying arguments into series over the basic solutions of the form  $P(t)e^{\lambda_1 t}$ , where  $P(t)$  is a polynomial, and  $\lambda_1$  is the root of the characteristic quasi-polynomial.

AUTHOR: Zverkin, A. M.

TITLE: The Dependence of the Stability of Solutions of Linear  
Differential Equations With Lagging Argument on the  
Choice of the Initial Moment

PERIODICAL: Vestnik Moskovskogo universiteta. Seriya matematiki,  
mekhaniki, astronomii, fiziki, khimii, 1959, No. 5, pp. 15-20

TEXT: The author considers equations of the type

$$(1) \quad y'(x) = \int_0^{x(s)} y(x-s) dr(x,s), \quad \Delta(x) \geq 0,$$

where the integration in the Stieltjes integral is carried out with respect to s. The author investigates the dependence of the stability of the solution on the initial moment of the perturbations. Especially the author considers cases, where the stability does not depend on the moment of the disturbing influence.

Theorem 1: For the stability of the trivial solution of (1), where  $r(x,s)$  is a nondecreasing function of s for arbitrary  $x$ ,  $A \leq x < \infty$ , it is necessary and sufficient that the integral

$$\int_A^\infty r(x, \Delta(x)) - r(x,0) dx$$

Card 1/2

A

69470

S/055/59/000/05/002/020

The Dependence of the Stability of Solutions of Linear Differential Equations With Lagging Argument on the Choice of the Initial Moment exists.

Theorem 4: If in the equation

$$(5) \quad y'(x) = a(x)y(x) + b(x)y(x - \tau(x)), \quad \tau(x) \geq 0$$

it is  $b(x) > 0$  for  $x > M$  and  $b(x) \neq 0$  in  $[A, M]$ ,  $\tau(x) \geq \alpha > 0$  and  $\tau'(x) \leq 1 - \beta$ ,  $\beta > 0$ , then from the stability under perturbations in the point  $A$  it follows the stability under perturbations in an arbitrary point.

TITLE:

The Oxidation of Zirconium at High Temperatures and the  
Structure of the Primary Oxide Films (Okisleniye tsirkoniya  
pri vysokikh temperaturakh i struktura pervichnykh oksidnykh  
plenok)

PERIODICAL: Atomnaya energiya, 1958, Vol 5, Nr 5, pp 550-553 (USSR)

ABSTRACT:

The investigation was carried out with two different layers of zirconium. In the first case, a small zirconium plate (dimensions: 8 . 15 . 0,5 mm) was used, which was produced by hot rolling. The plate was then annealed for one hour at a temperature of 700°C. Before oxidation the plate was chemically polished in a solution of 40 % nitric acid, 5 % hydrofluoric acid, and 55 % water. Oxidation took place in steam and dry oxygen at temperatures of from 150 to 800°C and under atmospheric pressure. The time of exposure varied between 15 minutes and 10 hours. By means of the scattering method the electrograms were taken on an electronograph of the type EM-4.

Card 1/3

SOV/89-5-5-7/27

The Oxidation of Zirconium at High Temperatures and the Structure of the Primary Oxide Films

In the second case the zirconium foils were produced by evaporation of the zirconium in a vacuum on a mica base. The foils produced were removed from the mica base in distilled water. Oxidation was carried out as described above. The radiographic investigations were carried out by means of a camera of the type RKU-86 (Cr radiation). It was found that oxidation develops in stages. During the first stage of oxidation a thin layer with a marked textured cubic modification and characterized by very considerable passivation forms. The second stage is characterized by the occurrence of a textured monoclinic modification, which is located above the cubic modification. A further increase of the thickness of the foil is possible only at the expense of the increase of the internal monoclinic modification. The third stage of oxidation is characterized by the vanishing of the textured black oxidation layer which consists of the cubic and monoclinic modifications. The black layer goes over into a white one. At this instant the rate of oxidation of zirconium increases very considerably.

The resistance to corrosion of the black layer might be

Card 2/3

SOV/89-5-5-7/27

The Oxidation of Zirconium at High Temperatures and the Structure of the Primary Oxide Films

brought into connection with the presence of a textured solid solution of zirconium in  $ZrO_2$ . It was possible to show that the protective properties of the black layer apparently vanish as soon as a maximum of saturation of this solid solution with oxygen is attained. The consequence is that a non-textured white zirconium oxide with the well-known stoichiometric composition is formed. There are 6 figures, 2 tables, and 6 references, 0 of which is Soviet.

TITLE: Machine for Studying the Endurance of Tubes Under Pressure  
With Cyclic Deflection (Mashina dlya issledovaniya  
dlitel'noy prochnosti trub pod davleniyem s tsiklicheskim  
izgibom)

PERIODICAL: Zavodskaya Laboratoriya, 1958, Vol 24, Nr 12,  
pp 1514 - 1516 (USSR)

ABSTRACT: The machine mentioned in the title was developed, produced,  
and used in the institute mentioned in the association  
in the beginning of 1957. The testing conditions  
correspond to the working conditions of tubes and vapor  
conductors in boiler works. The diagram given (Fig. 1)  
indicates that the tube sample is located in an electric  
furnace. The loading for the cyclic bending of the  
sample is carried out using an electric motor over an  
eccentric wheel. The pressure within the system is  
achieved in the same way as in the TsKTI apparatus,  
used for testing the endurance of tubes toward internal

Card 1/2

Machine for Studying the Endurance of Tubes Under Pressure With Cyclic Deflection

SOV/32-24-12-37/45

pressure (Ref 1). The error in measurement in relation to the bending moment is about 3%. The placing of the machine on the desired loading cycle is carried out by using cells attached to the lever. 15, 30, and 60 cycles per minute are proposed. Two samples can be determined simultaneously on the machine. There are 2 figures and 1 Soviet reference.

PERIODICAL: Teploenergetika, 1958, No.3. pp. 51-54 (USSR)

ABSTRACT: An installation for testing the long term strength of tubes with combined internal pressure and bending is illustrated diagrammatically in Fig.1 and a corresponding installation for combined pressure and torsion in Fig.2. The test section of the tube was contained in an electric furnace. The accuracy of the test data was of the order of 3 - 5%. The test specimens were made of austenitic steel 3H-694 (1X13H16B). For long term tensile tests the samples were made in the form of cylinders of 4.6 - 5.1 mm diameter with a length to diameter ratio of about 10 cut from the wall of the tube. For the main tests the specimens were pieces of steam superheater tubes of 32 x 5.6 mm in the condition as delivered. Tables 1 & 2 give data on long term strength tests on specimens in tension and tubes under pressure. Table.3 gives data for tubes subject only to torque and they lost their stability, large cracks were formed on the surface of the specimens. The results of tests with combined pressure and twisting are given in Table.4. There were individual cracks formed on the outer surface of the specimens and on the internal surface there was a network of fine cracks. (See illustrations in Figs.3 & 4). The results of tests on tubes

Blood concentration of vit. A and carotene of breast-fed infants suffering from various skin diseases and of their mothers was studied. A control group of healthy babies and their mothers was also investigated. It was found that: (1) Vit. A and carotene contents of the blood of healthy infants under one year of age show seasonal variation and changes dependent on the type of feeding. (2) In the case of erythroderma desquamativum the blood level of those substances is greatly lowered. (3) This fall depends on both exogenic and endogenic factors (gastro-intestinal disorders, disorders of liver function). (4) Vit. A and carotene concentration in the blood and milk of mothers breastfeeding babies suffering from erythroderma desquamativum is low. Addition of those substances to the diet of the mothers constitutes an integral part of the treatment. (5) In dermatitis herpetiformis of the newborn the blood levels of vit. A and carotene are low. This fall becomes even more accentuated in exfoliative dermatitis. (6) In cases of infantile eczema the amounts of circulating vit. A and carotene are larger than normal as a result of interference with general metabolism. (7) Administration of vit. A to infants suffering from eczema helps in restoration of normal metabolism. Administration of vit. A during pregnancy, especially in cases of toxæmia of pregnancy, is an important factor in prevention of skin disease in infants. (S)
